

Example Application

Do you know ...

Geofences are pre-defined locations with a radius where the entry and exit of employees need to be tracked.

- Customers have a choice between a circle or a polygon shape to set the radius.
- Geofences can be created from any map in the application.
- Geofence types and group assignments are additional available features.

Geofences make it possible to locate addresses of interest on the map easily, keep track of an employee's entrance and exit of the location, and store data for reporting purposes.
