

Do you know ...

Wireless form modules are digital forms that are custom-built based on a paper form or based on customer data collection needs.

- Module fields include basic field types, photo and signature fields, calculations for numbers and date/time, and special types for barcode scanning, NFCs, audio and file attachments, and custom lists.
- Sections of the form can be designated as separate pages to help organize and allow for handoffs.
- Repeatable fields can be re-selected if they need to be filled out multiple times.
- Form fields and pages can be set to only display when a previous condition has been met.

Wireless Form Modules are highly customizable and flexible forms designed to collect crucial data needed from the field to the office.

The screenshot displays the 'Module settings for: Application Module' interface. On the left, a vertical list of field types is shown: Text, Label, Number, Currency, Check boxes, Drop down, Radio, Email, Phone, Date-time, Calculation, Camera, Signature, and Scan. On the right, a preview of 'Page 1 of 1' is shown, featuring several form fields: a text field with 'Hello', a numeric field with '250', a currency field with '\$10.00', a checkbox section with three options, a drop-down menu with 'List Item 1', a radio button section with 'Yes' and 'No' options, and a date/time field. A signature field is also visible at the bottom right. An 'Advanced' dropdown menu is located at the bottom right of the preview area.
